Denise please send to robin ,tony and roger and don. I am wondering if someone can tell me which form of cd we are planning to measure??? I do not mean the the valencey which is only 2+. I am refering to which bound form we are thinking about measuring. Since the different bound forms represent different cellular /tissue/organ pools, eg liver or blood which one you decide to measure may not be a reflection of of what you think/ In addition we might have to consider special dietary questions as well as the occupational ones since there are foods that are exceptionally high in cd, eg liver and kidney two of george patskans favorite foods. Any thoughts
